Skillsoft Digital Skills Solution

Going digital is a priority for enterprises where increased **collaboration** across locations, increased **productivity**, and increased **agility** are key business objectives. 78% of business leaders expect their organizations to be digital in the next three years, yet only 51% of them have a strategy for developing those skills. Furthermore, most organizations are simply not prepared for the new work practices that adopting new technologies will bring, yet an increasing number of employees are expected to use them as a part of their daily routines. In a digitally literate organization, employees must be comfortable **finding** digital information; **analyzing, evaluating and creating** information with the help of the digital tools; and **participating**, **sharing**, and **collaborating** in our organizations *digitally*. To become digitally literate, they need easy access to the *right* digital skills training content and to quickly get answers to their "How do I..." questions whenever they arise.
